## I. INTRODUCTION

The Garrett Companies are planning to develop a parcel of land in the Town of Castle Rock, Colorado that will include a total of 238 multi-family dwelling units. The project is called Caliber at Terrain and it is located to the east and north of State Highway (SH) 86. Specifically, it is bounded on the west by SH 86 (Founders Parkway), on the north, east and south (partially) by the Terrain residential subdivision, and also by Founders Crossing on the south. The Terrain subdivision is comprised of single-family homes, while Founders Crossing is a retail parcel that currently includes a 7 -II convenience store and a Canvas credit union, but that is developing with other uses. Figure I provides a vicinity map of the project location.

Project access is planned via two routes: I) through Founders Crossing via Aloha Street for which motorists can access either Founders Parkway (to the west) or SH 86 (to the south), and 2 ) access towards the east through an existing roundabout at the Autumn Sage Street/Valley View Drive intersection. The Founders Parkway access route can provide all vehicle movements, while the SH 86/Aloha Street access is limited to only right-in/right-out (RIRO) movements. Access through the existing roundabout is into the Terrain subdivision and to SH 86 at a full-movement intersection.
Coordination with Town of Castle Rock staff resulted in the following specific elements for inclusion in this Traffic Impact Analysis:

- Evaluation of existing operational conditions
- Estimates of Background traffic volume projections for the Build-Out and Year 2040 timeframes for Caliber at Terrain
- Trip generation estimates for the proposed land uses
- Analysis of project impacts for Build-Out and Year 2040
- Recommendations for public improvements

The following sections of this report provide specific information on each of these issues. This revised report addresses comments from both the Town of Castle Rock and from the Colorado Department of Transportation (CDOT).

## II. EXISTING CONDITIONS

## II.A. Land Use

Caliber at Terrain is surrounded by existing or rapidly developing land. The Terrain single-family home subdivision bounds the property to the north and east, while the Escavera residential development is to the west across Founders Parkway. The Founders Village subdivision is to the south of SH 86 and two retail sites exist directly adjacent the proposed site and across SH 86 to the south. Outside of the immediate project vicinity are other residential areas either in the Town of Castle Rock or Douglas County, with some being large acre private parcels, while downtown Castle Rock and its varying amenities is located approximately two miles to the west.

## II.B. Roadway System

The Caliber at Terrain site is situated near the junction of a significant Colorado state highway and two major streets. These routes provide both regional access via the state highway network, and also roadway network connections to the Town of Castle Rock and to outlying areas of Douglas County. Figure 2 provides a representation of the surrounding roadway network, its laneage and speed limit characteristics. Following are more detailed descriptions of the primary roadways adjacent and near the project site.

## State Highway 86 (Founders Parkway)

SH 86 provides state highway access for local Castle Rock residents and also for regional travelers. Its origin is at I-25 in Castle Rock and it traverses the west side of Caliber at Terrain in a north/south alignment. At the intersection of SH 86, $5^{\text {th }}$ Street and Ridge Road, it turns to the east where it proceeds towards the towns of Franktown and Elizabeth with continual extension towards its eventual intersection with I-70 near the Town of Limon. SH 86 is classified as a Regional Highway (R-A) along its north/south alignment and as a Non-Rural Principal Highway (NR-A) along its east/west alignment.

Near the project site, SH 86 has two travel lanes in each direction along its north-south alignment, but only one lane in each direction as it proceeds towards Franktown. Several left and/or right turn lanes exist at intersections that provide access for Caliber at Terrain. The posted speed limit on SH 86 is 50 miles per hour ( mph ) along its north/south alignment and 55 mph along its east/west alignment. Traffic control at public street intersections is primarily via stop signs, but a traffic signal exists at the SH 86/5th Street/Ridge Road intersection.

## 5th Street

This street provides access from downtown Castle Rock to the SH 86/Ridge Road intersection and the Town's Transportation Master Plan identifies 5th Street as a Major Arterial. The posted speed along $5^{\text {th }}$ Street near the project site is 45 mph and there are two lanes for vehicle movements. Auxiliary lanes exist at public street intersections and 5th Street is planned to be widened to a four-lane roadway.

## Ridge Road

This street has similar characteristics as 5 th Street. It is also classified as a Major Arterial in the Castle Rock Transportation Master Plan, while it has a posted speed limit of 45 mph with auxiliary lanes at public street intersections. Ridge Road extends into Douglas County for access to relatively rural, large acre parcels of land. Ridge Road is also planned to be widened to a four-lane street.

NORTH

## Autumn Sage Street and Valley View Drive

These two streets serve the Terrain subdivision and they provide access internally and to streets that connect to the surrounding access network. Both streets have two lanes for vehicle movements and they are posted with a speed limit of 30 mph . Autumn Sage Street and Valley View Drive intersect at a single lane roundabout and the fourth leg of the intersection currently provides access to a Town of Castle Rock maintenance facility,

## Aloha Street and Aloha Drive

These two streets have been constructed within the Founders Crossing commercial site. Aloha Street traverses Founders Crossing with a north/south orientation with connection to the east/west segment of SH 86, while Aloha Drive is a relatively short street segment that connects Founders Parkway to Aloha Street. All vehicle movements are permitted at the Founders Parkway/Aloha Drive intersection, while vehicle movements are restricted to only RIRO movements at the SH 86/Aloha Street intersection.

## II.C. Traffic Volumes

The existing traffic volumes shown on Figure $\mathbf{3}$ are a compilation of both recorded and projected data. Town of Castle Rock staff provided three traffic studies for projects near the Caliber at Terrain site, being the Founders Crossing retail project, the Sunstone Village single-family home development, and Terrain Filing No. 3. Traffic volumes at the SH 86/5th Street/Ridge Road and SH 86/Founders Crossing intersections are replicated from these two studies using the summary of projected traffic volumes for their near-term analysis periods when these projects are completed. This approach was agreed to with Town staff and it is likely a conservative estimate of traffic volume for these two intersections. Daily traffic volume estimates are also replicated from these reports.

Traffic volumes at the Autumn Sage Street/Valley View Drive roundabout were recorded for this project. Since there is a reasonable amount of residential lots remaining to be developed in Terrain, these traffic volumes were increased $25 \%$ to replicate a more complete development scenario.

As shown on Figure 3, individual movements during the AM and PM peak hours can vary considerably depending upon the specific movement or the peak hour. Some movements to note at the SH 86/5th Street/Ridge Road Intersection include:

- Southbound left turn = 515 vehicles per hour (vph) (PM peak hour)
- Westbound right turn $=490 \mathrm{vph}$ (AM peak hour)
- Eastbound right turn $=395 \mathrm{vph}$ (PM peak hour)
- Northbound left turn $=465 \mathrm{vph}$ (AM peak hour)

These traffic volume levels suggest a strong orientation of movements to the west and north during the AM peak hour and the opposite affect during the PM peak hour; both of which indicate a home-to-work relationship to/from downtown Castle Rock and the Denver metropolitan area. Appendix A includes the recorded traffic volume data.

LEGEND
Traffic volumes are replicated from LSC Sunstone Village report for Year 2020.

## II.D. Traffic Control

Control of vehicle movements at the evaluated intersections include a traffic signal at the SH 86/5th Street/Ridge Road intersection, a stop sign on the westbound approach from Aloha Drive onto SH 86, stop signs on the northbound and southbound approaches at the SH 86/Autumn Sage Street intersection, and yield control at the Autumn Sage Street/Valley View Drive roundabout.

The SH 86/5th Street/Ridge Road traffic signal operates with protected-permissive left turn phasing on the east and west approaches, and with split phasing on the north and south approaches due to perceived sight distance issues. Right turn movements on all approaches are separated from the through movement by channelized islands and each movement has their own lane and a corresponding acceleration lane on the acceptance roadway.

## II.E. Traffic Operations

Traffic operations within the study area were evaluated according to techniques documented in the Highway Capacity Manual, $6^{\text {th }}$ Edition (Transportation Research Board, 2016) using the existing traffic volumes, intersection geometry, and traffic control. Level of Service (LOS) is a qualitative measure of traffic operational conditions based on roadway capacity and vehicle delay. LOS is described by a letter designation ranging from A to F , with LOS A representing almost free-flow travel, while LOS F represents congested conditions.

For stop-controlled intersections, LOS is calculated for each vehicle movement that must yield the right-of-way to an oncoming or crossing vehicle. Roundabout LOS is calculated based on the number of vehicles circulating within the roundabout versus those motorists attempting to join the circulating roundabout flow. Vehicular movements into a roundabout are controlled by yield signs.

Figure 4 shows the existing traffic control, intersection geometry, and results of the LOS analyses. Appendix B includes the LOS criteria and Appendix C includes the analysis worksheets for existing conditions.

Acceptable operating parameters of LOS D or better are experienced during the AM and PM peak hours except the westbound movement from Aloha Drive onto southbound SH 86. This movement is projected to operate at LOS F during both peak hours. Keep in mind that the traffic volume levels and resultant LOS calculations are based on the complete build-out of Founders Crossing and Sunstone Village, not existing traffic volume levels at the time of report preparation.

## III. BACKGROUND CONDITIONS

## III.A. Project Build-Out

Caliber at Terrain projects that the development completion timeframe for construction will be in the fall of 202I, approximately $2-1 / 2$ years from the original creation of this report.

## Roadway Network

It is understood that the Town of Castle Rock has received approval from CDOT to reconstruct the SH 86/5th Street/Ridge Road intersection into a two-lane roundabout. Specific design features are preliminary and the final design and construction schedule are not known. As such, for the Build-Out timeframe, this intersection is considered to have the same intersection geometry as currently exists and the traffic control method will still be a traffic signal.

## Traffic Volumes

Background traffic volume projections start with the information contained in the Existing Conditions section of this report. But when considering that the Existing Conditions traffic volumes represent the recording of existing traffic volumes along with the trip generation projections for Founders Crossing and Sunstone Village added, the Existing Conditions volume levels are likely a good representation of traffic volume levels for the Build-Out timeframe as well. This approach is specific to the three intersections along SH 86.

However, recent information was provided by representatives of Founders Crossing that provided revised land use and size data that was used to predict any changes in Background traffic volumes. Some land uses have changed and the resultant trip generation estimates are somewhat less than what was shown in the previous version of this report. Build-Out and Year 2040 Background traffic projections reflect these revisions.

With respect to the Autumn Ridge Street/Valley View Drive intersection, it was previously noted that the traffic volumes recorded for this report were increased by $25 \%$ to reflect the developing nature of Terrain. To reflect another $2-1 / 2$ years of traffic volume growth, the traffic volumes for this intersection were increased another 10\%. The traffic volumes represented on Figure 5 contain the projected background traffic volumes for the Build-Out timeframe of Caliber at Terrain.
Of note, the Town of Castle Rock requested that the SH 86/Autumn Ridge Street intersection be included in this revised study. The Town noted that information from other traffic studies can be used for this intersection. As such, traffic volume data and operational analysis results for this intersection are reproduced from a traffic study prepared by another firm.

## Traffic Control \& Intersection Operations

Background traffic volumes for project Build-Out were analyzed using the same HCM methodologies as identified in Section II. Traffic control for the SH 86/Aloha Drive intersection has been changed to traffic signalization for this timeframe based on discussions with Town staff.

Considering the traffic volume and traffic control information contained above, the operational analyses found that LOS D or better can be achieved during the AM and PM peak hours. Figure 6 represents the LOS analyses; Appendix $\mathbf{D}$ contains the operational analysis worksheets.

No physical intersection improvements are required. It will be necessary for CDOT (and the Town of Castle Rock) to monitor traffic signal operations to evaluate potential signal timing revisions at the SH 86/5th Street/Ridge Road and SH 86/Aloha Drive intersections, however.

## LEGEND

$X X X(X X X)=A M(P M)$ Peak Hour Traffic Volumes
$\mathbf{X X X X}=$ Daily Traffic Volumes

Traffic volumes are replicated from LSC Sunstone Village report for Year 2020.

## III.B. Year 2040

## Roadway Network

The Castle Rock Transportation Master Plan includes an evaluation of future traffic volumes and roadway laneage requirements for the Year 2040. In that document, it is identified that SH 86 will to be widened along both its north/south and east/west segments adjacent to the project site. The north/south segment is planned to be widened to six through lanes, while the east/west segment will be widened to four through lanes.

In regard to the type of traffic control for the SH 86/5th Street/Ridge Road intersection, and the identification of the installation of a multi-lane roundabout, Town staff has requested that the analyses for Year 2040 also include a traffic signal option.

## Traffic Volumes

Background traffic volume projections for the Year 2040 reflect that anticipated build-out of the entire Town of Castle Rock for which the Caliber at Terrain parcel can be considered a part. The traffic volume projections along SH 86 are 31,700 vehicles per day (vpd) along its north/south alignment and $23,800 \mathrm{vpd}$ along the east/west segment.

These levels of growth equate to about an $81 \%$ increase in traffic ( $3 \%$ annually) for the north/south segment of SH 86 and about $39 \%$ (I.6\% yearly) for the east/west alignment of SH 86. These levels of growth were applied to the existing vehicle movements to create a background condition for the Year 2040. Figure 7 represents the traffic volume estimates for this timeframe.

Traffic volumes for the Autumn Sage Street/Valley View Drive intersection, a location that is internal to the Terrain subdivision, are not expected to grow beyond the Build-Out timeframe since development surrounding this roundabout will be completed. As such, the Year 2040 traffic volumes at this intersection are the same as for the Build-Out scenario.

## Traffic Control \& Intersection Operations

Given the improvements planned along SH 86 and through the intersections along this route, intersection LOS for the Year 2040 Background condition finds that the SH 86/5th Street/Ridge Road intersection will operate better as a signalized intersection versus a roundabout given the geometric assumptions and traffic volumes used for this project. This intersection is projected to operate at LOS C or D during the two peak hours with traffic signal control (no LOS F movements), while a roundabout option is projected to have LOS F conditions for several movements.

The other study intersections are projected to operate acceptably for this time period. LOS results and intersection improvements are shown on Figure 8 and operational worksheets are included in Appendix E.

## III.C. Signal Warrant Analysis - SH 86/Autumn Sage Intersection

The Town of Castle Rock has specifically requested an analysis of whether this intersection will meet any of the traffic signalization warrants contained in the Manual on Uniform Traffic Control Devices (MUTCD). The only warrant that can be evaluated with any confidence is Warrant 3, Peak Hour. While it is recognized that this warrant is not appropriate for a normal public street intersection, it is the best one to use when evaluating peak hour traffic volumes for future timeframes. The results of this analysis find that traffic volume levels for the Build-Out timeframe do not meet Warrant 3 criteria; however, traffic volumes for the Year 2040 will (based on southbound movements). As such, the operational analysis for the Year 2040 Background scenario uses a traffic signal as the traffic control method.

| LEGEND |

| $\mathbf{X X X X}=$ Daily Traffic Volumes |

## IV. CALIBER AT TERRAIN BUILD-OUT CONDITIONS

This section summarizes the proposed land uses, the daily and peak hour traffic volume projections, the Build-Out and Year 2040 operational analyses, and recommended infrastructure improvements.

## IV.A. Land Uses

The Garrett Companies are planning to construct 238 multi-family dwelling units on a vacant parcel of land located in the eastern portion of the Town of Castle Rock. The project site is situated to the south and west of the Terrain residential housing development, to the east of SH 86, and it borders Founders Crossing along its south property line. A school administration building is planned to the east of the Garrett Companies property. That school administration building is not included in this report, however.

Figure 9 represents the proposed site plan for Caliber at Terrain. As shown on this figure, the proposed townhomes will be split to the north and south of an extension of the existing Aloha Street. Connection points for the Aloha Street extension is with Founders Crossing on the south and at the Autumn Sage Street/Valley View Drive roundabout to the east.

## IV.B. Trip Generation Estimates \& Trip Assignment

Table I includes the trip generation estimates for the Build-Out of Caliber at Terrain and these estimates are based on information contained in Trip Generation, I $0^{\text {th }}$ Edition, by the Institute of Transportation Engineers (ITE), 2017.

## Table I. Caliber at Terrain Trip Generation Estimates

| Land Use | Unit | Size | Daily | AM Peak Hour |  |  | PM Peak Hour |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  |  |  |  | In | Out | Total | In | Out | Total |
| Townhomes' | DU | 238 | 1,759 | 25 | 84 | 109 | 81 | 47 | 128 |
| ' $^{\text {Land Use Code 220. }}$ |  |  |  |  |  |  |  |  |  |

The assignment of vehicle-trips to the adjacent street network is based on existing travel patterns, on daily traffic volume projections contained in the Town of Castle Rock Transportation Master Plan, the orientation of the site, and on engineering judgment. These distribution percentages are included on Figure IO, along with the assignment of the projected Caliber at Terrain vehicle-trips. Figure II and Figure $\mathbf{1 2}$ represent the compilation of the site generated traffic volumes and the Build-Out and Year 2040 Background traffic volumes.

## IV.C. Traffic Control and Intersection Operations

As shown on Figure 10, it is estimated that Caliber at Terrain will add less than 40 vph to any one intersection movement. As such, about one vehicle every 90 seconds on average will affect intersection operations even during the highest trip generation times of the day.

Operational analyses were conducted following the HCM methodologies noted previously in this report. The results of these analyses are included in the following sections.

## Project Build-Out

SH 86/5th Street/Ridge Road Intersection - This intersection is not projected to require any physical or operational improvements related to the construction of Caliber at Terrain. LOS estimates are LOS C to D during the AM and PM peak hours (Figure I3). CDOT should continue to monitor traffic volume levels and make traffic signal timing adjustments if necessary.

SH 86/Aloha Drive Intersection - It is understood that this intersection is being planned for the installation of a traffic signal by the Town of Castle Rock and it is projected that this traffic signal will be installed by the Build-Out timeframe. Considering that traffic signal timing parameters are not exactly known at this time, some assumptions were made relative to the LOS analyses. These assumptions include using a 90 second traffic signal cycle length and a three-phase operation, allowing for the operational software to optimize the individual phasing allowances. Considering these assumptions, it is projected that the new traffic signal can operate at LOS B or better during the AM and PM peak hours.

SH 86/Autumn Sage Street Intersection - Northbound and southbound left turn movements are projected to operate poorly at LOS F during the AM and PM peak hour. This is a result primarily related to the level of vehicle flow along SH 86 than the side street movements since the northbound and southbound left turn volume level is projected to be about one vehicle every 90 seconds or less. This intersection is not projected to meet criteria for the installation of traffic signalization for this timeframe, however.

SH 86/Aloha Street Intersection - LOS C or better is projected for this intersection with its continued operation with only RIRO movements.

Autumn Sage Street/Valley View Drive Intersection - This intersection is projected to continue to operate at LOS A during the AM and PM peak hours.

## Year 2040

SH 86/5th Street/Ridge Road Intersection - As noted previously in this report, the Town has requested that this intersection be evaluated as a roundabout and also as a signalized intersection. Analyses for Year 2040, given the traffic volume projections and geometric laneage found on Figure 14, find that a two-lane roundabout, even with right turn bypass lanes on each approach, will operate poorly during the AM or PM peak hours. LOS $F$ is expected for varying movements.

When controlled by a traffic signal, and given the lane geometry on Figure 14, this intersection is projected to operate at LOS C and D during the AM and PM peak hours, respectively (no individual movements at LOS F). A 120 second traffic signal cycle length was used for this analysis.

SH 86/Aloha Drive Intersection - Good intersection operations can continue to occur for the Year 2040 timeframe since vehicle movements to/from Founders Crossing are not expected to grow given the built-out nature of the commercial development. LOS B is expected for the AM and PM peak hours given a continued three-phase signal, a I 20 second traffic signal cycle length, and the additional through lanes for this timeframe.

SH 86/Autumn Sage Street Intersection - As noted previously, this intersection is projected to meet MUTCD criteria for installation of a traffic signal by the Year 2040. With traffic signal control, this intersection is projected to operate at LOS B during the AM and PM peak hours.

SH 86/Aloha Street Intersection - LOS B or better can be achieved for the restricted movements given the additional SH 86 laneage that is projected by Year 2040.

Autumn Sage Street/Valley View Drive Intersection - This intersection is projected to continue to operate at LOS A during the AM and PM peak hours.

## IV.D. Intersection Queuing Analysis

A vehicle queuing analysis was conducted to compare projected $95{ }^{\text {th }}$ percentile queue estimates for the Build-Out and Year 2040 timeframes to understand whether or not certain left turn lanes may need be to be lengthened. This analysis focused only on the southbound left turn lane at the SH 86/Founders Crossing intersection and the eastbound left turn lane at the SH 86/Autumn Sage Street intersections since the SH $86 / 5^{\text {th }}$ Street/Ridge Road intersection is expected to be reconstructed and, therefore, turn lane lengths will be evaluated during that design process.

The results of this analysis at the SH 86/Founders Crossing left turn lane finds that the 95th percentile vehicle queue will be about I50' in the Year 2040. When combined with the CDOT deceleration lane criteria for a 50 mph roadway, it may be necessary in the future to increase the southbound left turn length. However, any increase in left turn lane length should be monitored and evaluated with future recorded traffic volumes and with varying signal timing parameters. Any increase in left turn lane length is not directly related to the development of Caliber at Terrain, however, since the traffic volumes for this project are only a portion of the projected total amount. This intersection should be periodically monitored to more definitively understand whether this deceleration should be lengthened or not.

Vehicle queuing for the eastbound left turn movement at the SH 86/Autumn Sage Street intersection finds that queues lengths will be relatively small. When SH 86 is widened to four through lanes, existing traffic volume at that time should be checked to evaluate any left turn lane revisions.

## IV.E. Internal Founders Crossing Intersection

The Town of Castle Rock requested the analysis of a particular situation, one that is not related to the intersection analyses contained in previous sections of this report. This issue relates to the internal " $T$ " intersection within Founders Crossing where Aloha Street and Aloha Drive intersect. Currently, this intersection uses a stop sign to control vehicle movements on the eastbound approach to Aloha Street. Since Caliber at Terrain will have an access connection to Aloha Street, the Town's question was whether or not the traffic control for this intersection should be converted to an all-way stop condition.

An analysis was conducted to evaluate this situation using trip generation data contained in the Founders Crossing TIA (by LSC) and the trip generation predictions for Caliber at Terrain. To be conservative in these analyses, it was assumed that all vehicle-trips for the AM and PM peak hour would travel through this intersection, a condition that would not be the case.

Nevertheless, it was found that stop-sign control on the eastbound approach can operate at LOS C or better during the AM and PM peak hours. Conversion to an all-way stop condition can also provide good vehicle operations; however, it is not necessary to do so.

## IV.F. Improvement Recommendations

Caliber at Terrain is projected to have a minimal impact to the surrounding roadway and intersection network as a result of three primary factors:
I. The Town of Castle Rock's Transportation Master Plan has identified roadway laneage improvements that provide sufficient capacity to absorb the traffic volume predictions.
2. Three points of access allow for the distribution of traffic through several intersections which reduces the operational impact at any one location or for any one movement.
3. The level of traffic for any one movement at any intersection is about one vehicle per minute during the highest hours of vehicle activity over the course of a typical weekday; other hours will have less of an impact.

As such, the traffic volumes associated with the Caliber at Terrain project can be absorbed into the vehicle travel streams without undue congestion impacts. No roadway or intersection improvements are recommended as part of this project.

## V. SUMMARY AND RECOMMENDATIONS

The Garrett Companies is planning to develop a parcel of land in the Town of Castle Rock, Colorado that will include a total of 238 multi-family dwelling units. The project is called Caliber at Terrain and it is located to the east and north of State Highway (SH) 86. Specifically, it is bounded on the west by SH 86 (Founders Parkway), on the north, east and south (partially) by the Terrain residential subdivision, and also by Founders Crossing on the south.

Project access is planned via two routes: I) through Founders Crossing via Aloha Street for which motorists can access either Founders Parkway (to the west) or SH 86 (to the south), and 2 ) access towards the east through an existing roundabout at the Autumn Sage Street/Valley View Drive intersection. The Founders Parkway access route can provide full-movement access, while the SH 86/Aloha Street access is limited to only right-in/right-out (RIRO) movements. Access through the existing roundabout is into the Terrain subdivision and to SH 86 at a full-movement intersection also.

Projected vehicle-trips for Caliber at Terrain is about I,760 vehicles per day with approximately IIO during the AM peak hour and about I30 during the PM peak hour. These traffic volumes will have several access routes that will result in their distribution through several intersections and across several left turn, through or right turn movements. As a result, the traffic increase for any one intersection movement is relatively low, being about one vehicle every 90 seconds on average during the peak hours of vehicle activity.

As a result of this distribution of movements, operational analyses of the study area intersections find that Caliber at Terrain will have a very low impact at any intersection when considering the traffic volumes that will already exist at these intersections and when considering the planned roadway improvements that are identified in the Town of Castle Rock Transportation Master Plan.

Good levels of service will result with the traditional intersection configurations shown on Figure 13 and Figure 14 in this report, i.e., with traffic signalization at the $5^{\text {th }}$ Street/Ridge Road, Founders Crossing, and Autumn Sage Street intersections along SH 86. Level of service results will be LOS D or better during the Build-Out and Year 2040 timeframes.

It must be noted, however, that a multi-lane roundabout at the SH 86/5th Street/Ridge Road intersection is not projected to operate as well. With the projected roundabout geometry as shown on Figure 8 or Figure 14, several movements are projected to operate poorly at LOS F during the peak hours. Analyses for the roundabout operation as contained in the report are not as exhaustive as what has been conducted for the Town of Castle Rock evaluation of this intersection, however.

When considering the planned roadway improvements and estimated traffic volumes, it is projected that Caliber at Terrain can be absorbed into the roadway and intersection network without causing any undue traffic congestion. As such, roadway and intersection improvements beyond those already planned are not necessary.

## APPENDIX B. LEVEL OF SERVICE CRITERIA

TABLE BI
LEVEL OF SERVICE CRITERIA FOR
TWO-WAY STOP CONTROLLED (TWSC) INTERSECTIONS

| Level of Service | Delay Range (sec/veh) |
| :---: | :---: |
| A | $0.0-10.0$ |
| B | $>10.0-15.0$ |
| C | $>15.0-25.0$ |
| D | $>25.0-35.0$ |
| E | $>35.0-50.0$ |
| F | $>50.0$ |

Adapted from: Highway Capacity Manual, Transportation Research Board, 2010.

TABLE B2
LEVEL OF SERVICE CRITERIA FOR SIGNALIZED INTERSECTIONS

| Level of <br> Service | Control Delay <br> (sec/veh) | Qualitative Description |
| :---: | :---: | :--- |
| A | $\leq 10.0$ | Good progression, short cycles, very few vehicle-stops. |
| B | $>10.0-20.0$ | Good progression, and/or short cycle lengths, more <br> vehicle-stops. |
| C | $>20.0-35.0$ | Fair progression and/or longer cycle lengths, some <br> individual cycle failures, many vehicle-stops |
| D | $>35.0-55.0$ | Noticeable congestion and cycle failures, unfavorable <br> progression, high v/c ratios, several stops. |
| E | $>85.0-80.0$ | Limit of acceptable delay, poor progression, long cycles, <br> high v/c ratios, frequent cycle failures. |
| F | Delay is unacceptable to most drivers, volume exceeds <br> capacity, breakdown of traffic flow. |  |
| Adapted from: Highway Capacity Manual, Transportation Research Board, 20I0. |  |  |

| Intersection Summary |  |  |  |  |  |  |  |  |  |  |  |  |

Cycle Length: 125
Actuated Cycle Length: 100.9
Control Type: Semi Act-Uncoord
Maximum v/c Ratio: 1.10
Intersection Signal Delay: 41.2
Intersection LOS: D
Intersection Capacity Utilization 78.8\%
ICU Level of Service D
Analysis Period (min) 15
~ Volume exceeds capacity, queue is theoretically infinite.
Queue shown is maximum after two cycles.
\# 95th percentile volume exceeds capacity, queue may be longer.
Queue shown is maximum after two cycles.
Splits and Phases: 1: Ridge Road/SH 86 \& 5th Street

## Intersection Summary

Cycle Length： 125
Actuated Cycle Length： 116.1
Control Type：Semi Act－Uncoord
Maximum v／c Ratio： 1.12
Intersection Signal Delay： 52.6
Intersection LOS：D
Intersection Capacity Utilization 88．2\％ ICU Level of Service E
Analysis Period（min） 15
～Volume exceeds capacity，queue is theoretically infinite．
Queue shown is maximum after two cycles．
\＃95th percentile volume exceeds capacity，queue may be longer．
Queue shown is maximum after two cycles．
Splits and Phases：1：Ridge Road／SH 86 \＆5th Street
